NPN, TO-3

Description:

Complementary silicon power transistors.

The 2N3773 power transistors designed for high power audio, disk head positioners and other linear applications.

These devices can also be used in power switching circuits such as relay or solenoid drivers. DC-DC converters or inverters.

Features:

- Pb-free packages
- High safe operating area (100% tested) 150W at 100V
- Completely characterized for linear operation
- High DC current gain and low saturation voltage
- $h_{FE} = 15$ (Min.) at 8A, 4V
- $V_{CE(sat)} = 1.4V$ (Max.) at $I_C = 8A$, $I_B = 0.8A$
- For low distortion complementary designs

Maximum Ratings (Note 1)

Rating	Symbol	Value	Unit
Collector-Emitter Voltage	V_{CEO}	140	V DC
Collector-Emitter Voltage	V_{CEX}	160	
Collector-Base Voltage	V_{CBO}		
Emitter-Base Voltage	V_{EBO}	7	
Collector Current -Continuous -Peak (Note 2)	I_C	16 30	A DC
Base Current -Continuous -Peak (Note 2)	I_B	4 15	
Total Device Dissipation at $T_A = 25^\circ C$ Derate above $25^\circ C$	P_D	150 0.855	W W/ $^\circ C$
Operating and Storage Junction Temperature Range	T_J, T_{stg}	-65 to +200	$^\circ C$

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

1. Indicates JEDEC registered data.
2. Pulse test: pulse width = $5\mu s$, duty cycle $\leq 10\%$.

Power Derating

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate $I_C - V_{CE}$ limits of the transistor that must be observed for reliable operation i.e., the transistor must not be subjected to greater dissipation than curves indicate. The data is based on $T_J (PK) = 200^\circ C$; T_C is variable depending on conditions. Second breakdown pulse limits are valid for duty cycles to 10% provided $T_J (PK) < 200^\circ C$. At high case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown.
